Boston Harbor Improvement Project

LIFE

Boston Harbor Improvement Project

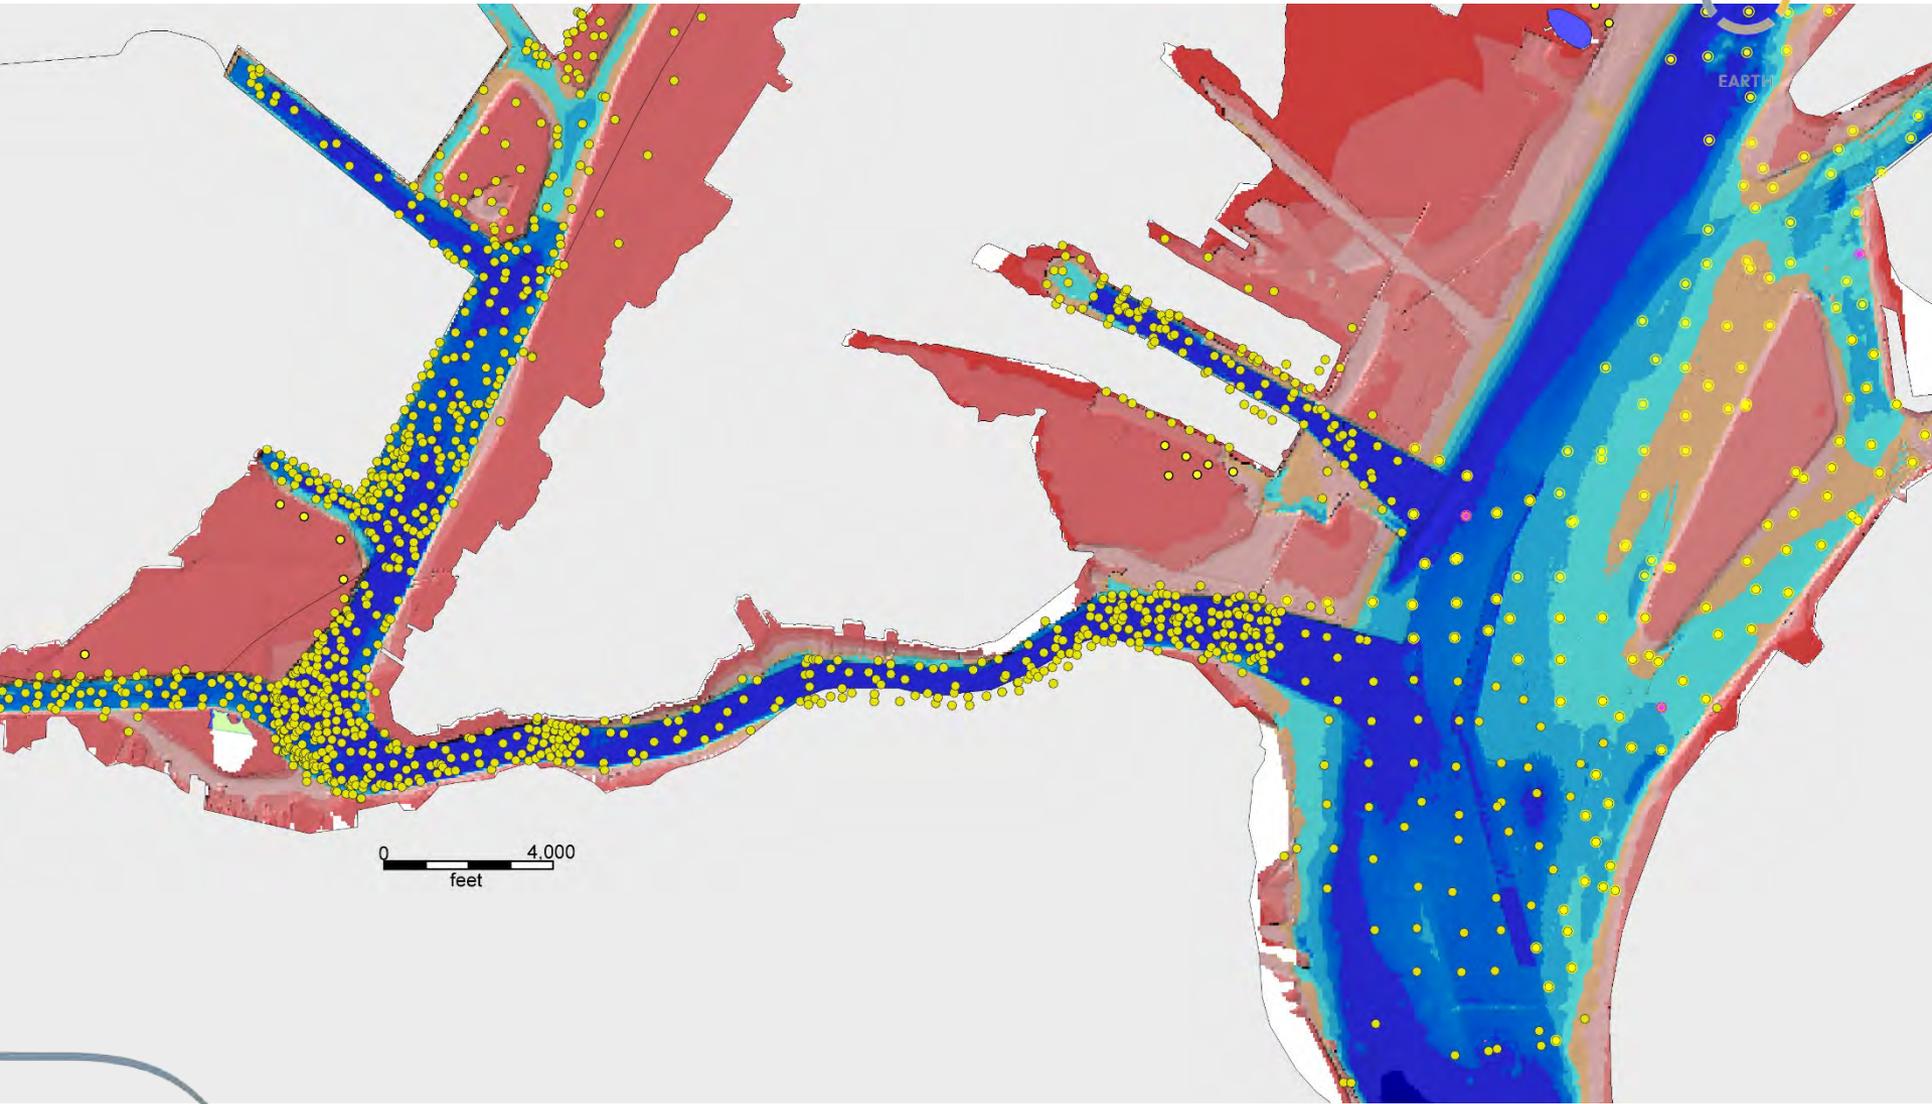

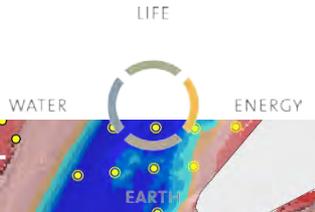

Geological mapping of subsurface
Mapping 3D distribution of dredge material

Historically done with borings

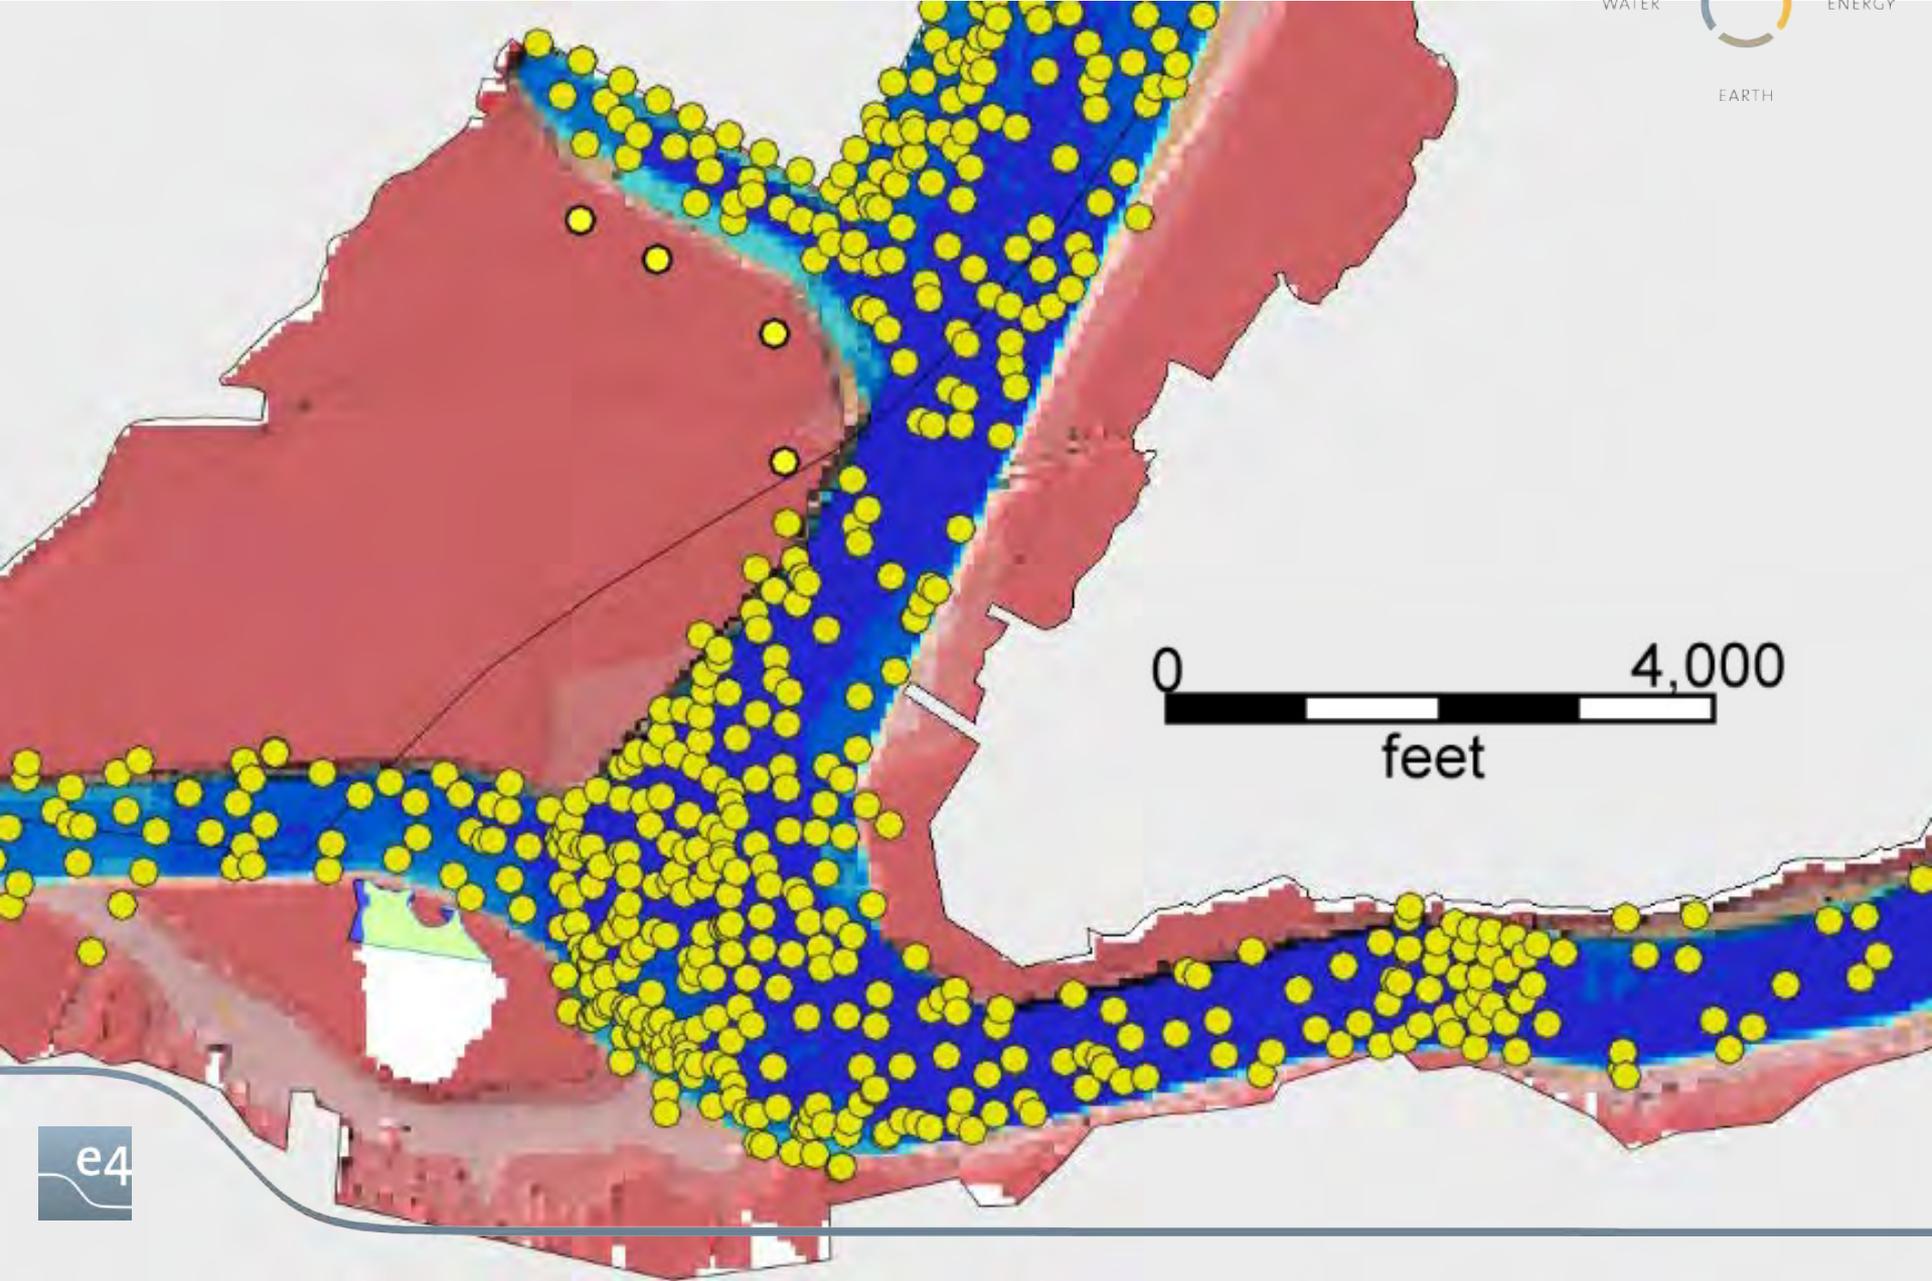

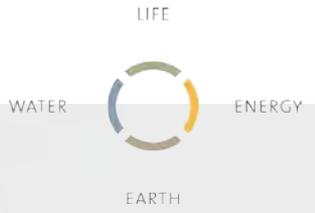

New York New Jersey Harbor

>2,000 borings

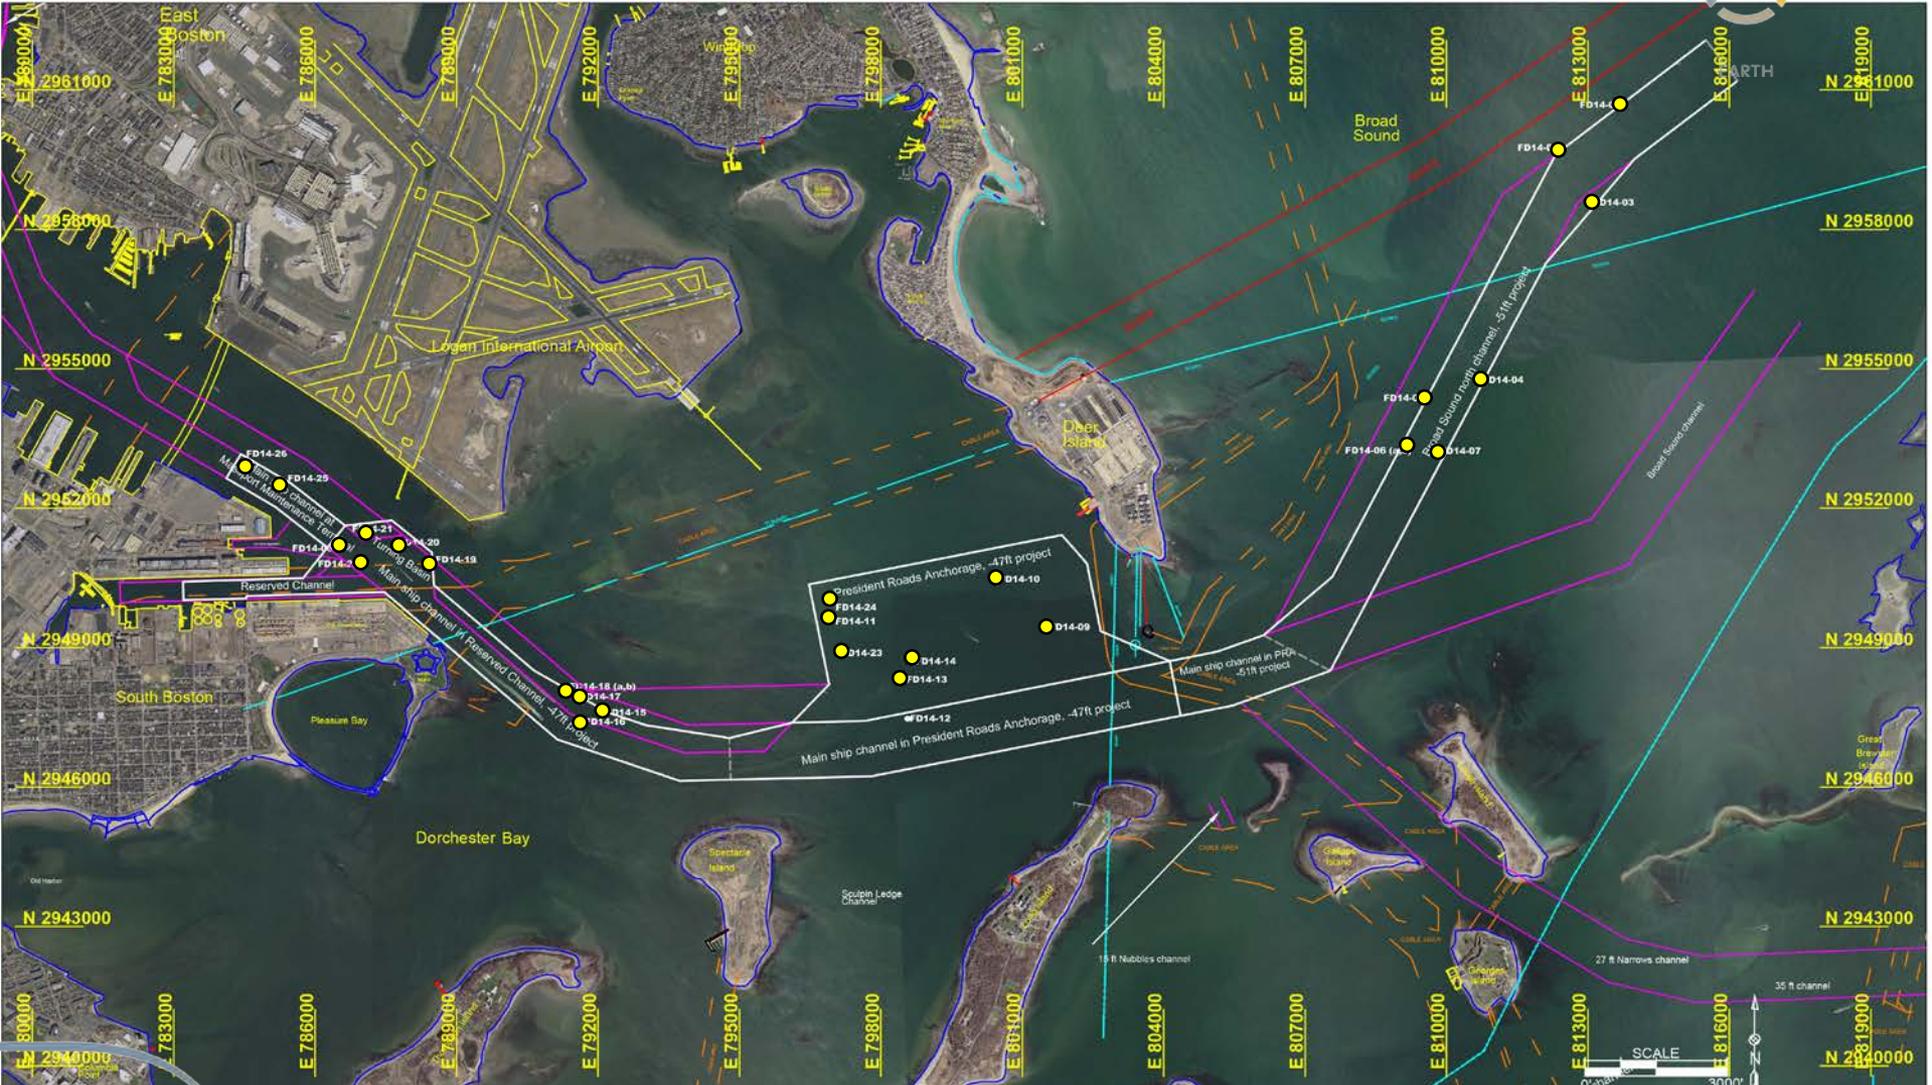

New York New Jersey Harbor

>2,000 borings

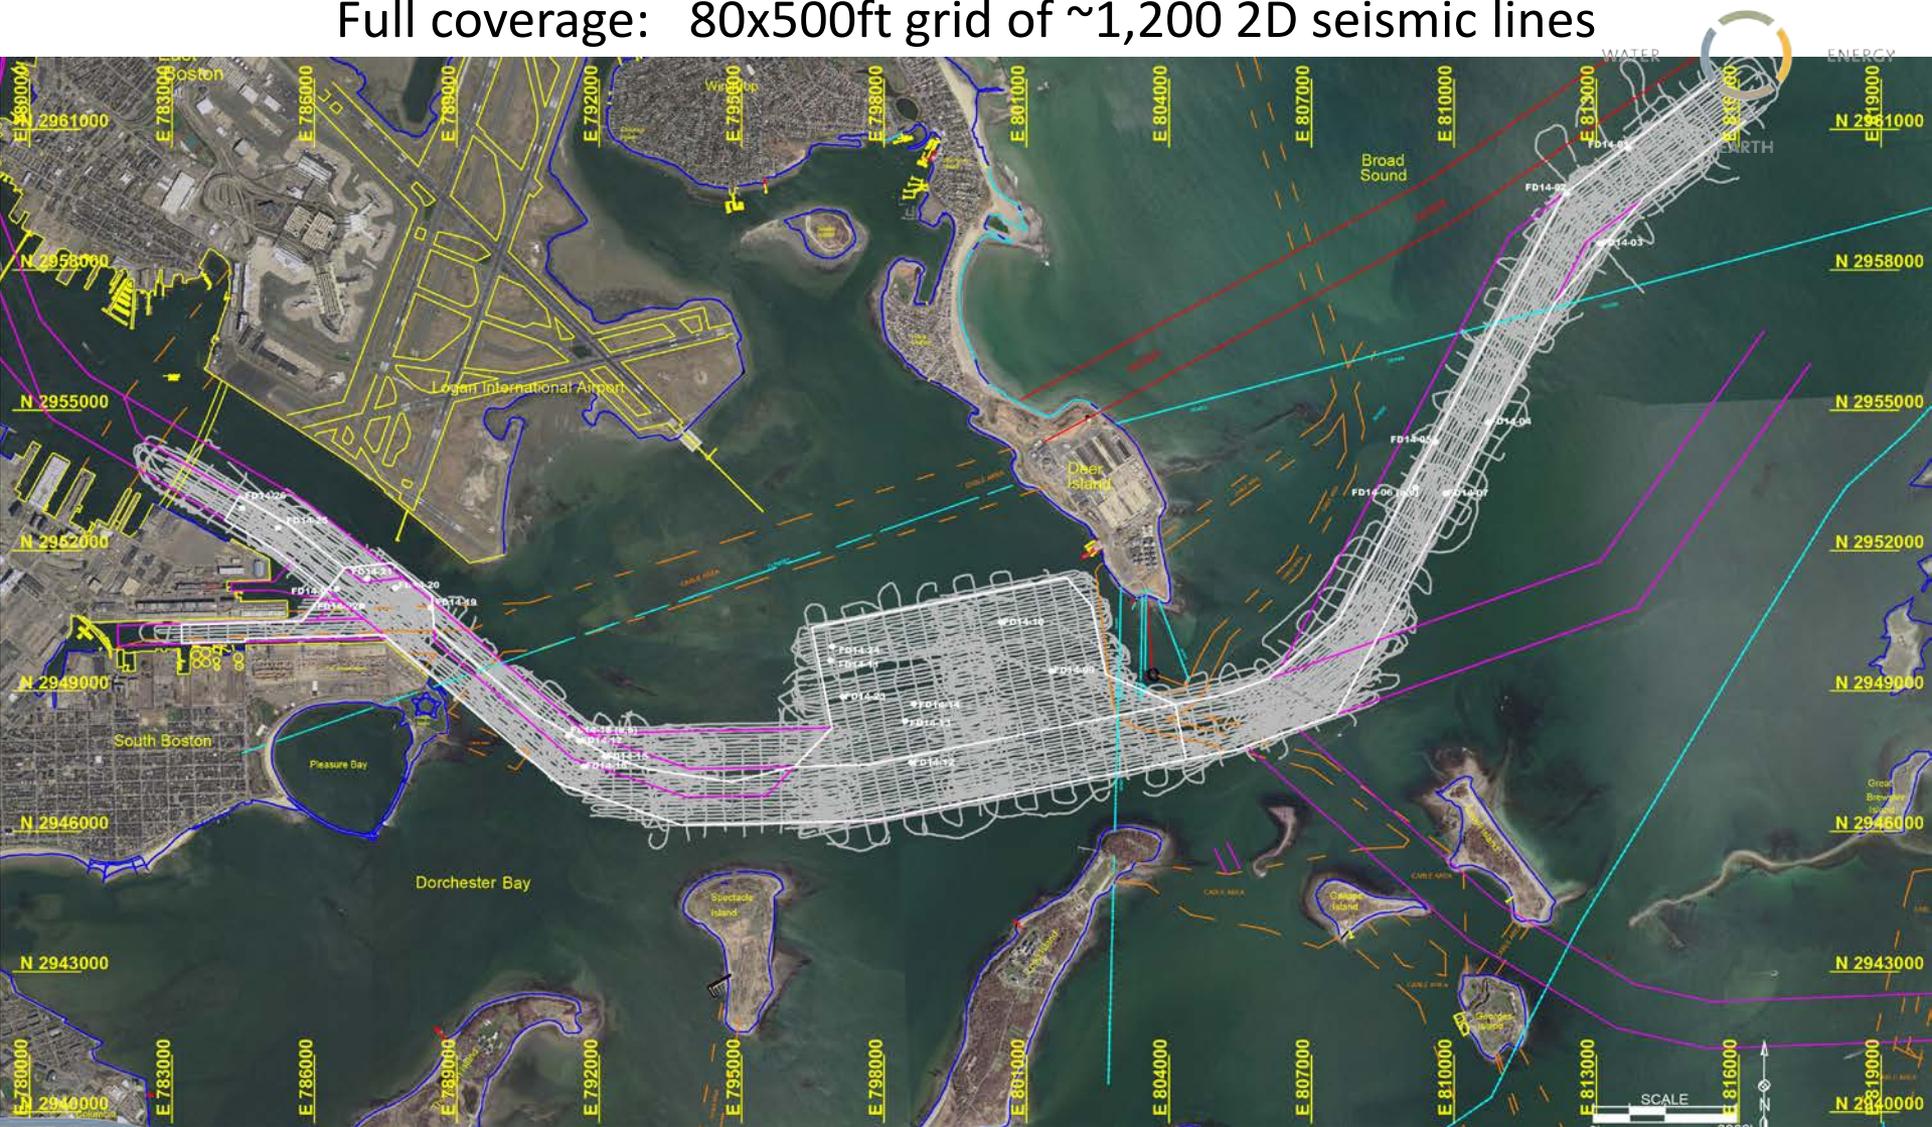

Boston Harbor

Borings

Reflection seismic tracklines

Full coverage: 80x500ft grid of ~1,200 2D seismic lines

Geological mapping of subsurface

Mapping 3D distribution of dredge material

Harbor geology

Mapping the harbor floor

Mapping the subsurface

borings

reflection seismic

example

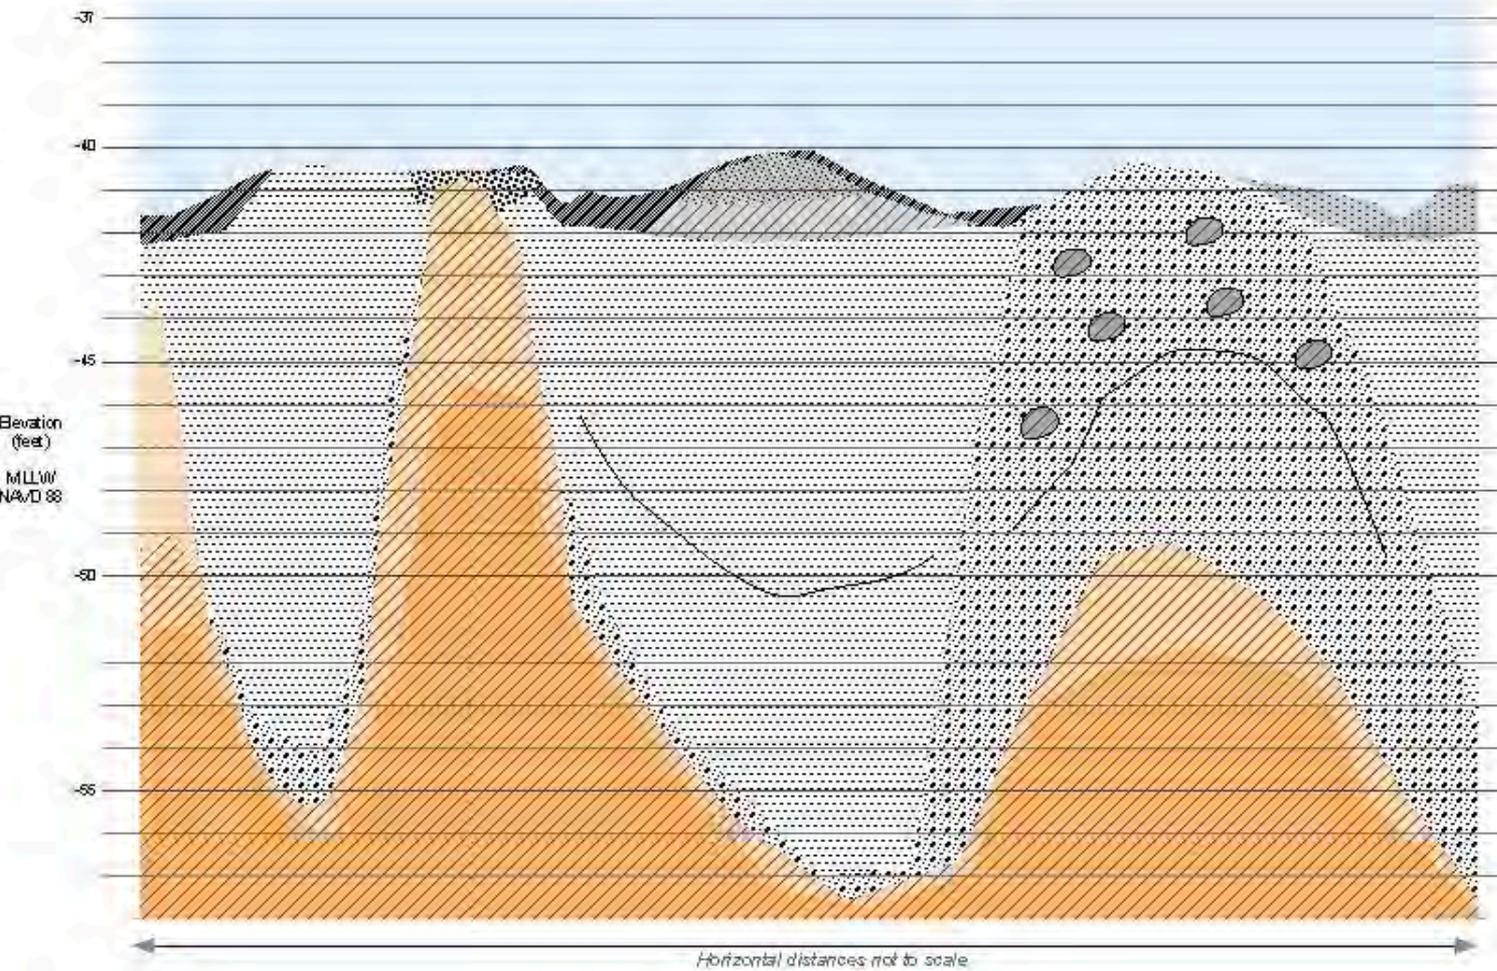

geological principles

geology is predictive

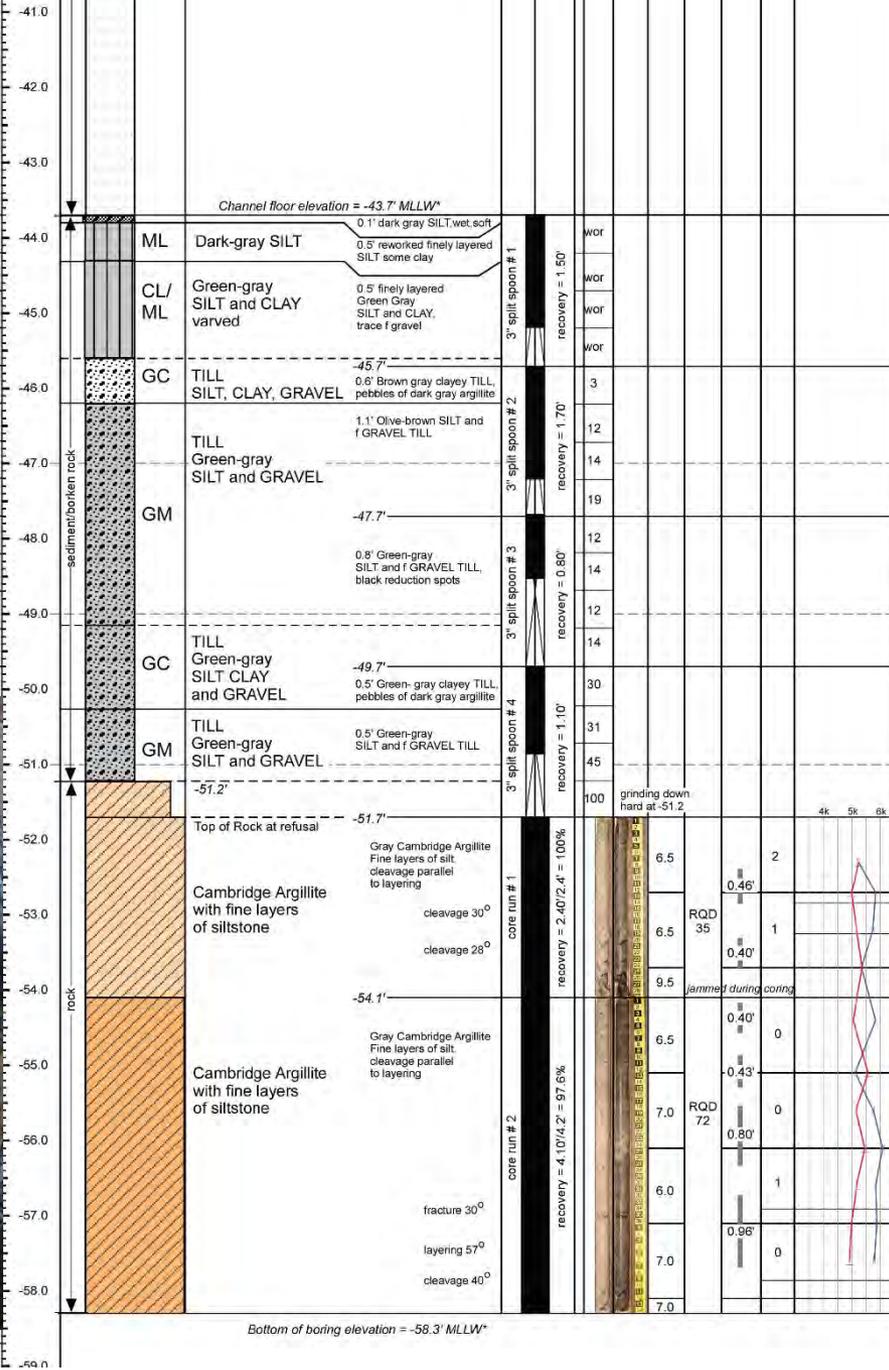

borings test hypotheses from seismic

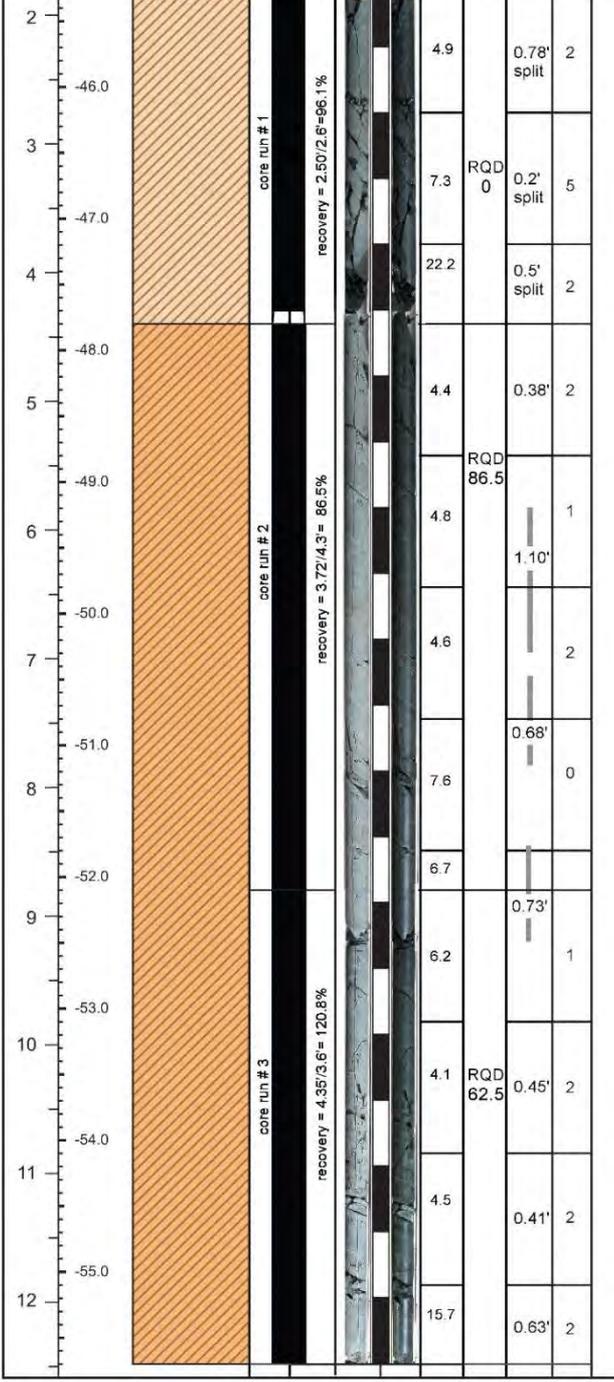

seismic test hypotheses from borings

Boston Harbor Stratigraphy

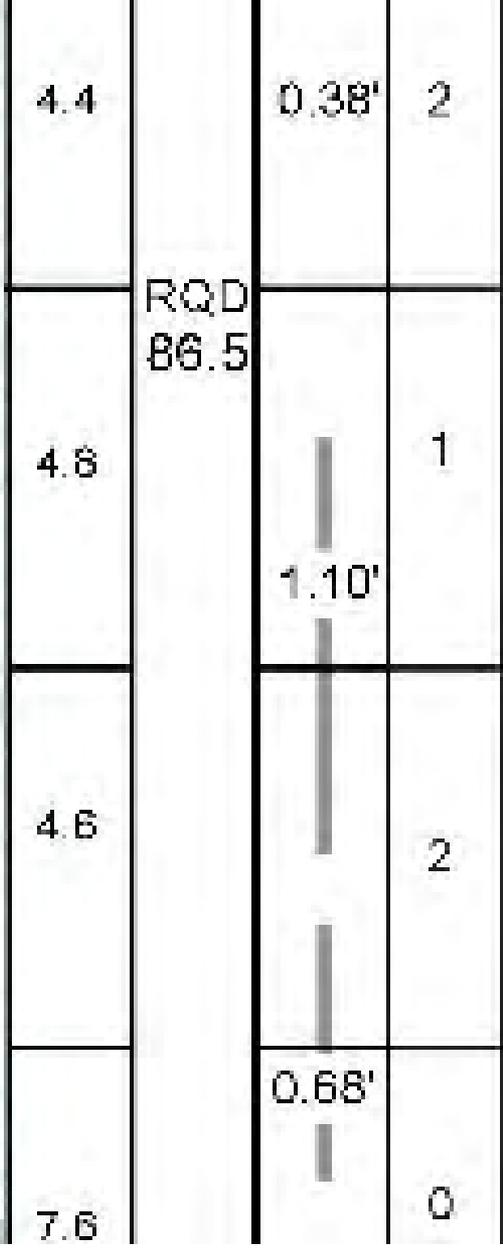

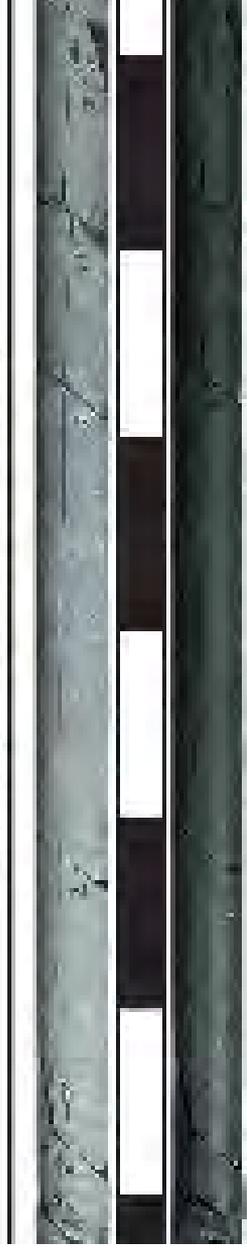

Key to geological units	
Holocene sediment	Recent black silt
	Recent/Holocene sand
	Recent gravel
	Holocene clay and silt
	Holocene peat
Pleistocene sediment	Boston Blue Clay Pleistocene glacial marine clay
	Pleistocene glacial till 2
	Pleistocene glacial till 1
Bedrock	Decomposed to highly weathered Cambridge Argillite
	Cambridge Argillite with RQD < 50
	Cambridge Argillite with RQD > 50

recovery = 3.72/4.3 = 86.5%

Geological mapping of subsurface

Mapping 3D distribution of dredge material

Harbor geology

Mapping the harbor floor

Mapping the subsurface

borings

reflection seismic

example

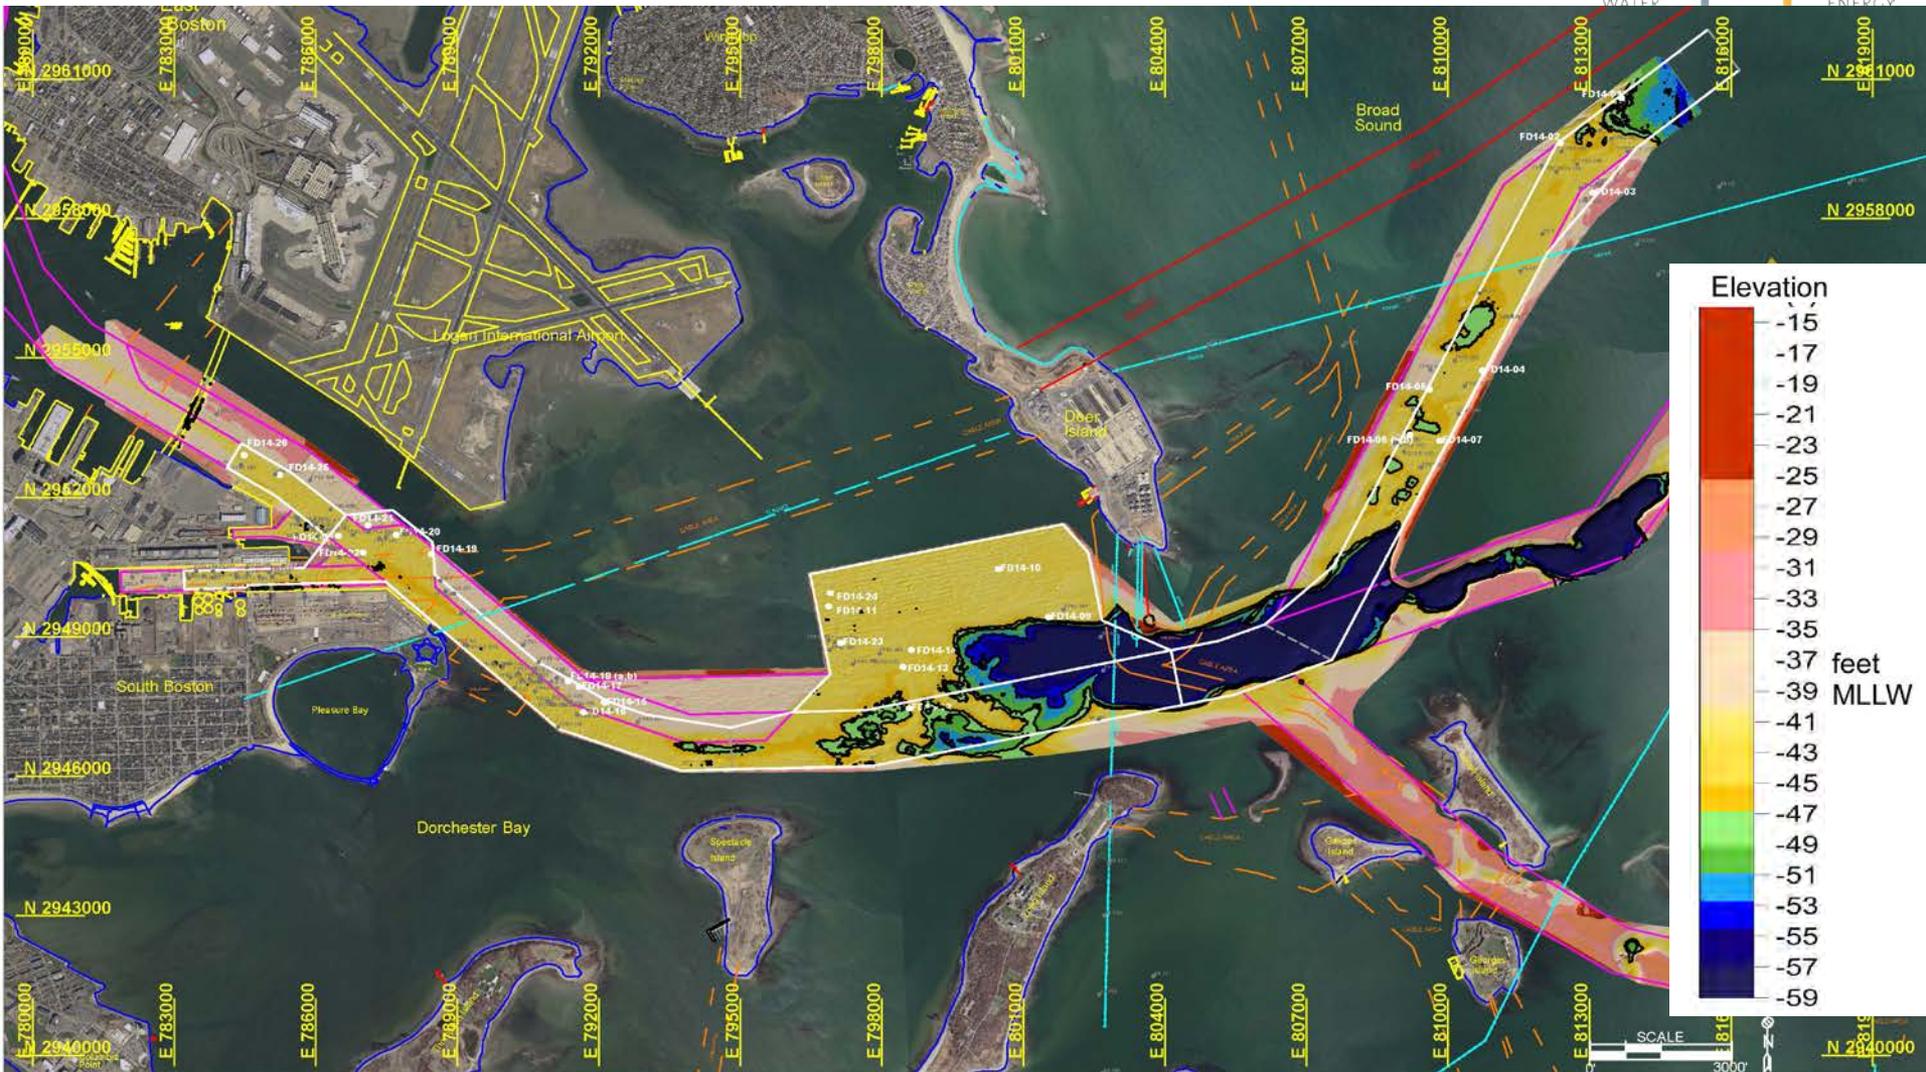

geological principles

predictive of geology

borings as tests of hypothesis

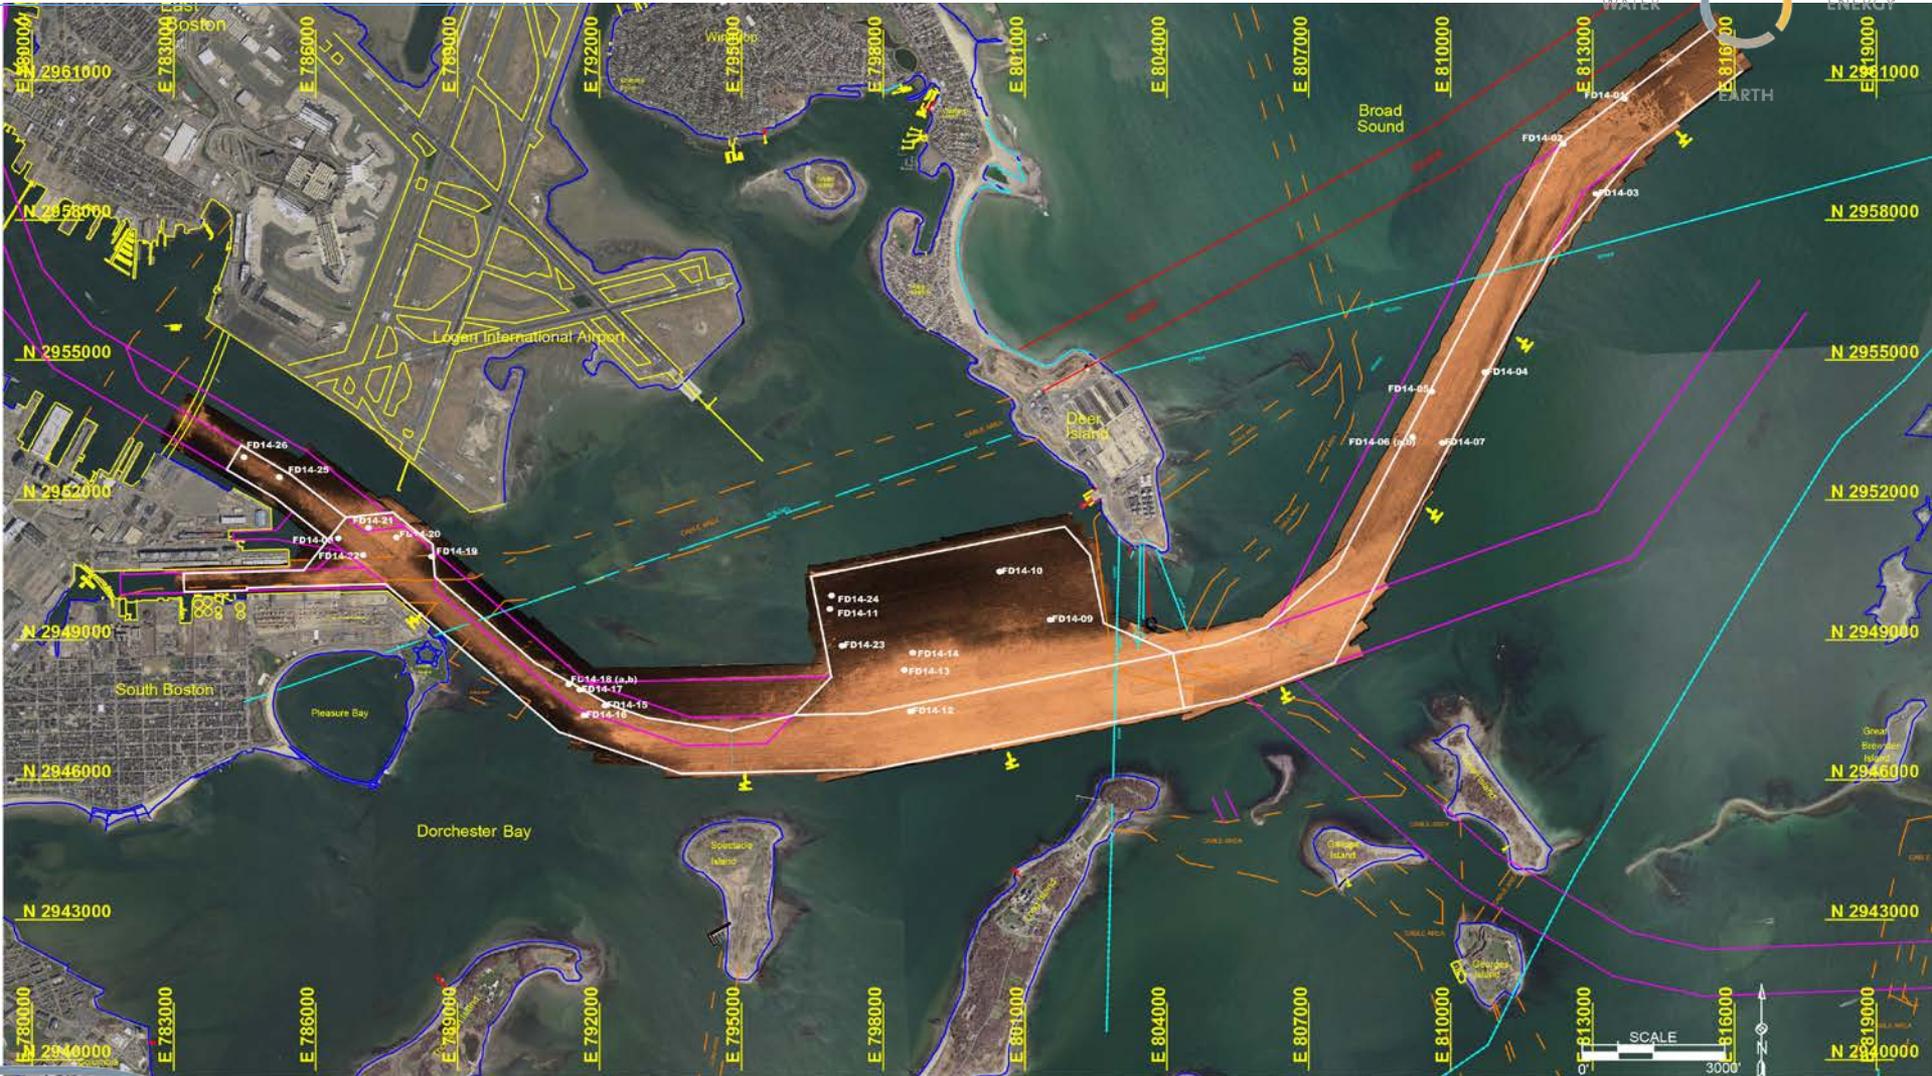

USACE Bathymetry

full coverage of harbor floor: 3x3ft grid

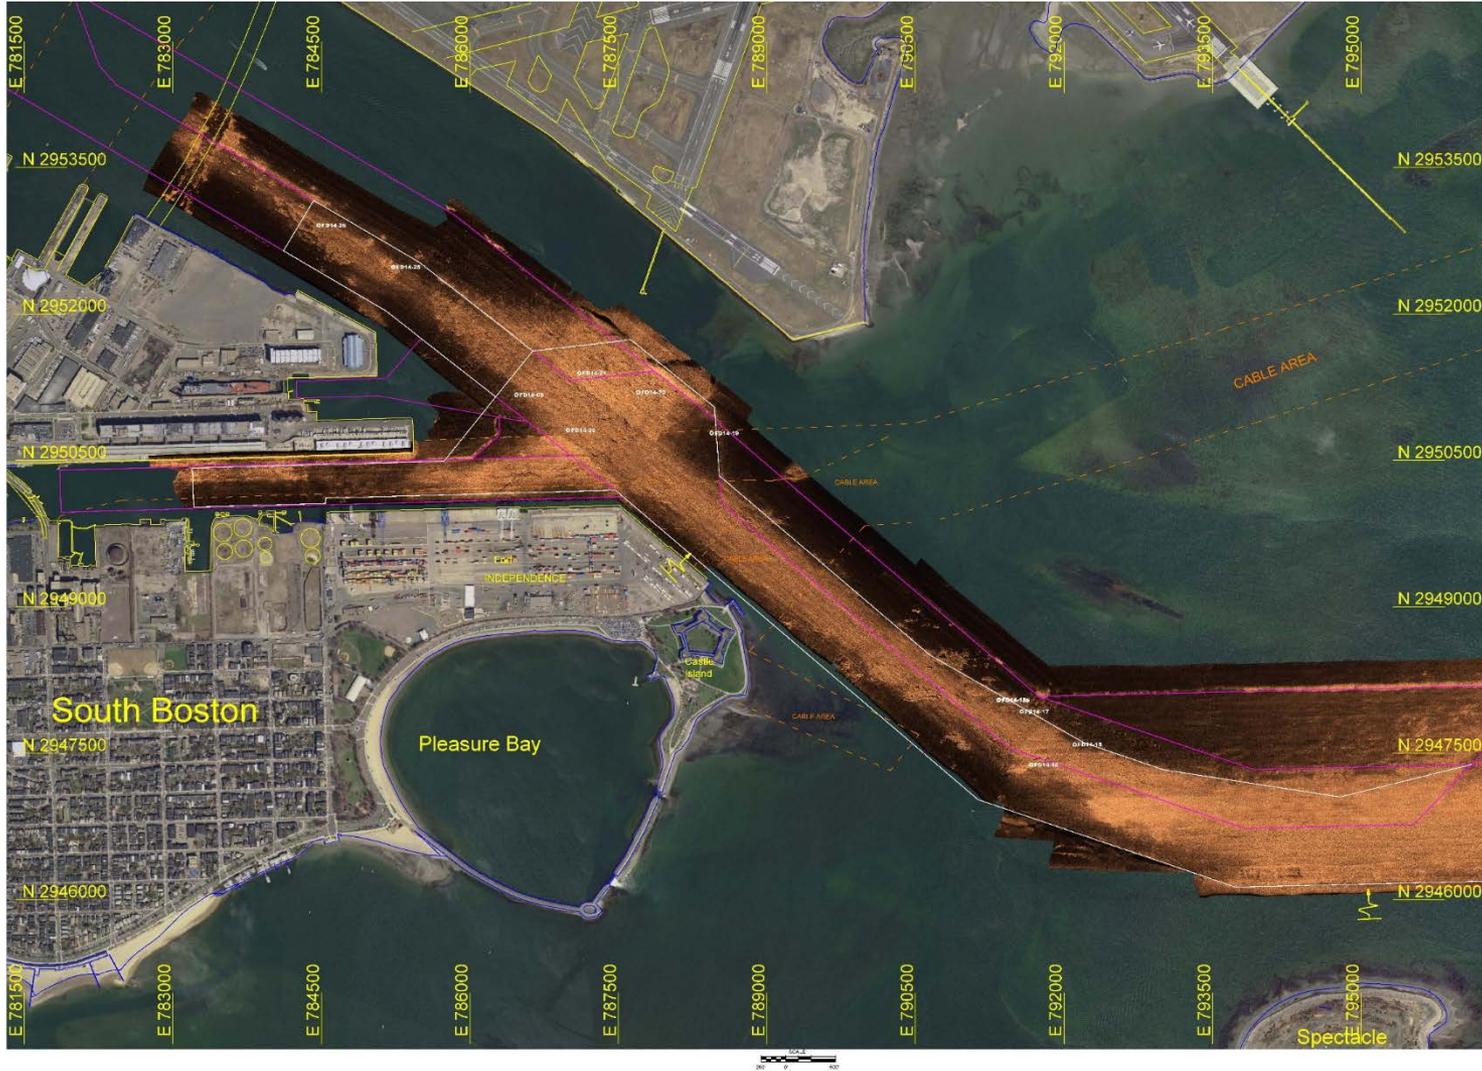

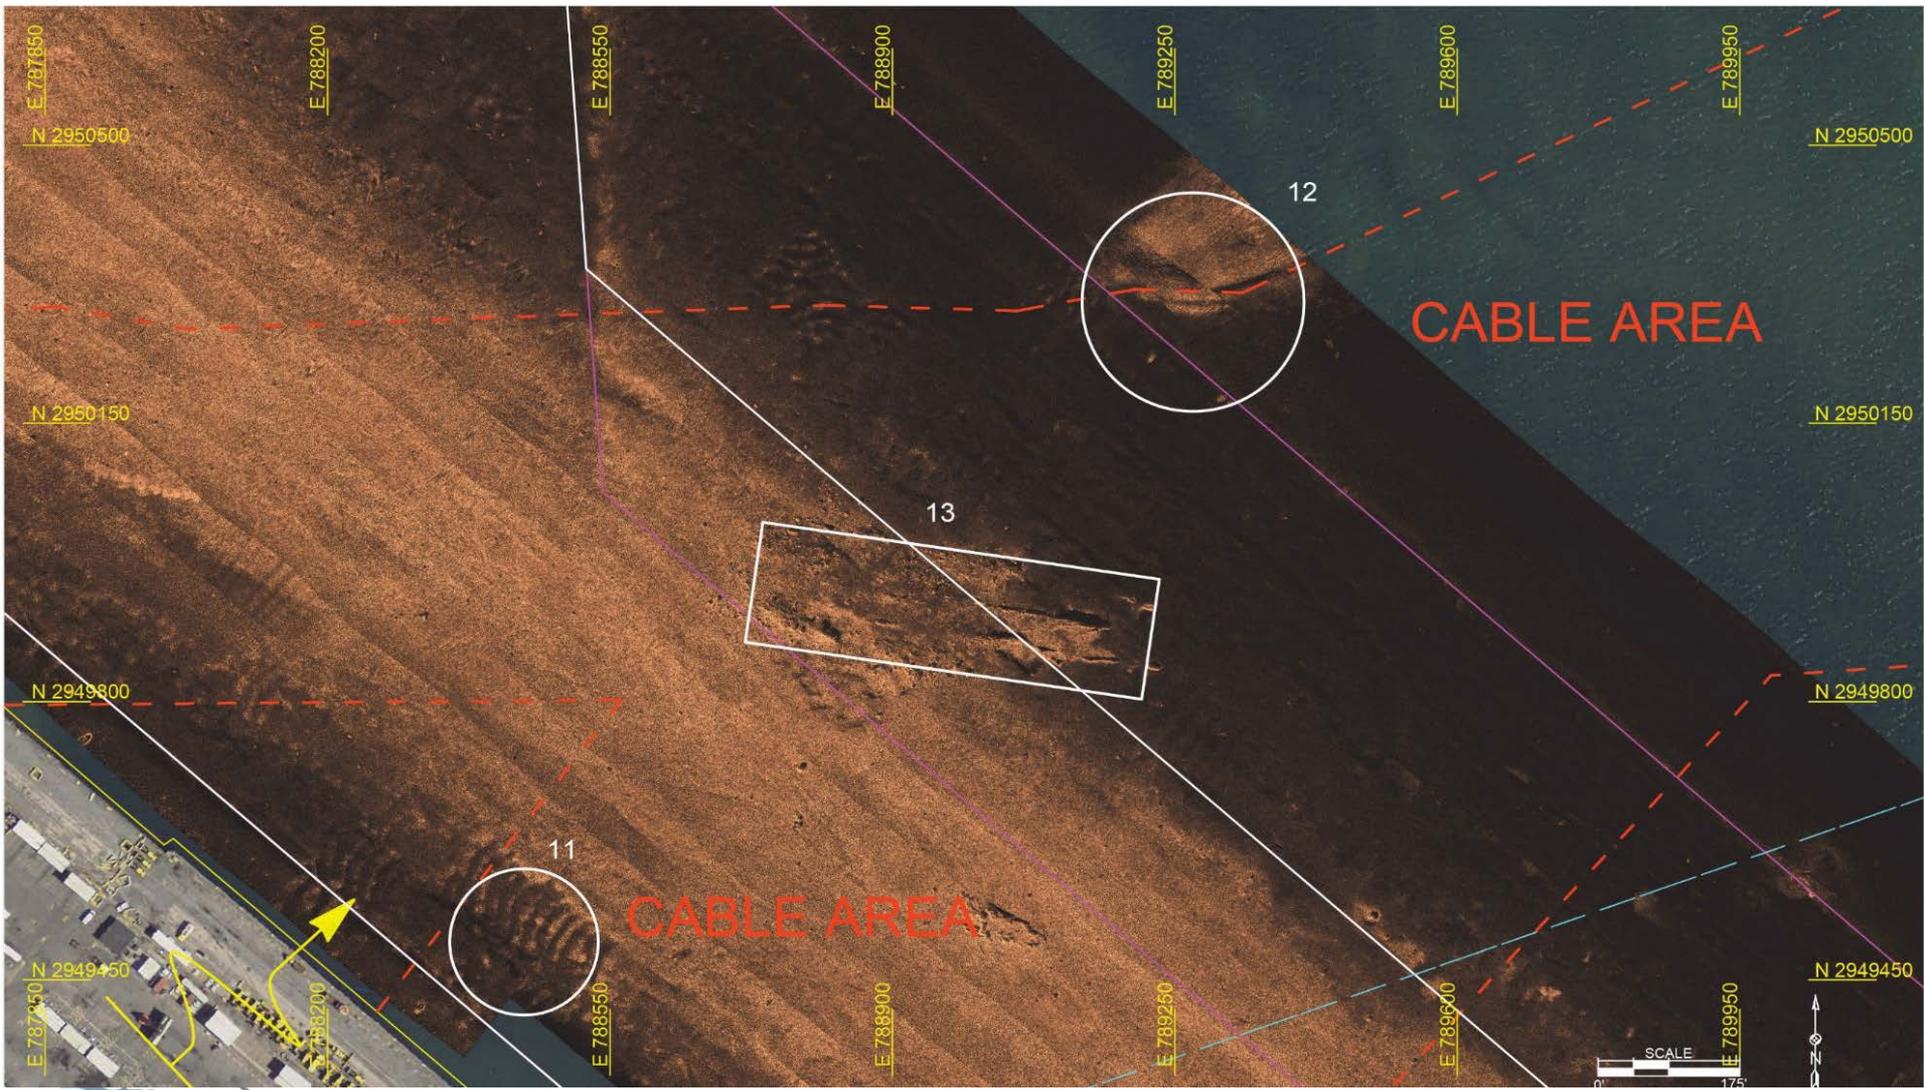

Orthosonographs

continuous coverage image of harbor floor: 1 pixel < 10x10cm
